Optimization of a monomial

Fix some vector $\mathbf{w} = (w_1, \dots, w_n) \in \mathbb{R}^n$.

Optimize $f_{\mathbf{w}} : \mathbf{x} \mapsto x_1^{w_1} \cdots x_n^{w_n}$ on a variety $X \subset (\mathbb{C}^*)^n$.

Figure: A variety where we can optimize $f_{\mathbf{w}}$

What is the number of critical points of f ? Does it depend on the choice of \mathbf{w} ? For generic \mathbf{w} , no!

This number is called the **maximum likelihood degree** of a model X . If X is a vector space, $\text{MLDeg}(X) = \beta(M(V))$.

Edge weight problem

Given $G = (V, E)$, fix some vector $\mathbf{w} = (w_1, \dots, w_n) \in \mathbb{R}^n$.

Figure: Find x and y edge weights that are *compatible* with G and $(G \setminus z)^*$.

- The sum of the weights is \mathbf{w} .
- **(Compatible)** Every cycle has at least two minimal edges.

Fix $\mathbf{w} = (0, 1, 1, 2, 2, 5, 3, 4, 7)$.

Figure: Find \mathbf{x} and \mathbf{y} edge weights that are *compatible* with G and $(G \setminus z)^*$.

	a	b	c	d	e	f	g	h	i
\mathbf{x}	00	01	00	00	02	03	00	00	02
\mathbf{y}	000	110	111	222	20	52	33	44	75
\mathbf{w}	0	1	1	2	2	5	3	4	7

- 3 The Bergman Fan
- 4 Degree of Bergman Fan

Graphical matroid

Given a graph $G = (V, E)$, the collection of edges E forms a matroid.

Independent sets \mapsto forests

Basis \mapsto Spanning forests

Circuits \mapsto Simple cycles

Rank of set $A \subseteq E \mapsto$ size of largest spanning forest

Flats

Maximal sets with a fixed rank.

That is, F is a flat if for any $i \notin F$, $r_M(F \cup i) > r_M(F)$.

\emptyset , matchings, complete subgraphs, ...

$$\{\emptyset \subsetneq a \subsetneq za \subsetneq zafg \subsetneq abcdefghi\}$$

The uniform matroid

Basis of the uniform matroid $U_{n,k}$ = all sets of size k in $[n]$.
Any set of size $\leq k$ is independent.

Figure: Matroid $U_{7,5}$ along with a basis B and independent set I .

Any set of size $\leq k - 1$ is a flat.
Any complete flag of flats is of the form

$$\{\emptyset \subsetneq \{v_1\} \subsetneq \{v_1, v_2\} \subsetneq \cdots \subsetneq \{v_1, \dots, v_{k-1}\} \subsetneq [n]\}$$

The Bergman Fan

$$\Sigma_M := \{ \vec{x} \in \mathbb{R}^n \mid \forall \text{ circuits } C \text{ we have } \min_{c \in C} x_c \text{ is attained twice} \}.$$

$$\Sigma_M := \{ \vec{x} \in \mathbb{R}^n / \mathbb{1}\mathbb{R} \mid \forall \text{ circuits } C \text{ we have } \min_{c \in C} x_c \text{ is attained twice} \}.$$

If $M = U_{n,k}$, any set of size $k + 1$ is a circuit.

A point $\vec{x} \in \mathbb{R}^n$ is on the Bergman fan if $\#\{i \in E \mid x_i > \min \vec{x}\} \leq k - 1$.

$$\Sigma_M = \bigcup_{|I|=n-k+1} \{ \vec{x} \in \mathbb{R}^n / \mathbb{1}\mathbb{R} \mid \arg \min \vec{x} \subseteq I \}.$$

$$\Sigma_{U_{3,2}} = \{(a, a, b) \mid a \leq b\} \cup \{(a, b, a) \mid a \leq b\} \cup \{(b, a, a) \mid a \leq b\}.$$

Figure: Two elements in the Bergman fan of the graphical matroid

Theorem (Sturmfels and Feichner, 2004)

The Bergman Fan of a matroid decomposes into the following cones

$$\Sigma_M = \bigcup_{\mathcal{F} \text{ flag of flats}} \mathcal{C}_{\mathcal{F}} = \bigcup_{\substack{F_1 \subset \dots \subset F_k \\ \text{flag of flats}}} \{x_i \geq x_j \text{ whenever } i \in F_k, j \notin F_k\}.$$

Problem

Can we compute the degree of the tropical variety Σ_M ?

Figure: A variety X : Degree = # of intersections with a **line** in \mathbb{C}^n .

Just intersect it with a hyperplane with dimension $= n - \dim X$

Note: Hyperplanes in the tropical world are Bergman fans of $U_{n,k}$.

Example of degree computation

Consider M the graphical matroid of K_5 , of rank 4 (so $\dim \Sigma_M = 3$). One has $\Sigma_M \subseteq \mathbb{R}^{10}/\mathbb{R}\mathbf{1}$, we intersect it with a hyperplane of $\dim = 6$.

$$|\Sigma_{U_{10,7}} + \underbrace{(1, 10, 100, 1000, \dots, 10^9)}_{\vec{w}} \cap \Sigma_M| = ?$$

Figure: There is only one $x \in \Sigma_M$ and $y \in \Sigma_U$ such that $y + w = x$. Such vector x belongs to a **cone determined by the greedy basis of M** .

Activities

Fix total order in V , ground set of a matroid M , basis B .

- $e \in B$ is internal activity if $e = \min C^\perp$, where $C^\perp \subseteq B^c \cup e$ is a cocircuit (a cut of the graph).
- $e \notin B$ is external activity if $e = \min C$, where $C \subseteq B \cup i$ is a circuit.

Figure: Fix order $z < a < b < c < d < e < f < g < h < i$.

$i(befg) = 0$, $e(befg) = 2$, $i(zadf) = 2$, $e(zadf) = 1$

$i(B) = 0$ nbc basis. $i(B) = 0$ and $e(B) = 1$ β -nbc basis

Degree computations

Theorem (Greedy basis algorithm)

$$\deg(\Sigma_M) = \Sigma_M \cap (\mathbf{w} + \Sigma_{U_{n,n-k-1}}) = 1$$

Theorem (Adiprasito, Huh, Katz, 2018)

$$\deg(-\Sigma_M) = (-\Sigma_M) \cap (\mathbf{w} + \Sigma_{U_{n,n-k-1}}) = \#\{nbc \text{ bases}\}$$

Theorem (Agostini, Brysiewicz, Fevola, Kühne, Sturmfels, Telen 2021 and Ardila, Eur, P 2022)

$$\deg(\Sigma_{(M/0)^\perp} \cdot -\Sigma_M) = (-\Sigma_M) \cap (\mathbf{w} + \Sigma_{(M/0)^\perp}) = \#\{\beta - nbc \text{ bases}\}$$

Finding Nemø points form nbc bases

$$\deg(\Sigma_{(M/0)^\perp} \cdot -\Sigma_M) = ?$$

Fix generic $\mathbf{w} = (10^{i-1})_i$.

Find $\mathbf{x} \in \Sigma_M, \mathbf{y} \in \Sigma_{(M/0)^\perp}$ such that $\mathbf{x} + \mathbf{y} = \mathbf{w}$.

Find a β -nbc basis $B = zbeg \rightarrow g|e|bd|zacfhi$,

corresponding β -nbc cobasis $B^\perp = acdfhi \rightarrow i|h|f|gd|c|eba$.

	a	b	c	d	e	f	g	h	i
\mathbf{x}	0	9	0	9	$10^4 - 1$	0	$10^6 - 10^3 + 9$	0	0
\mathbf{y}	1	1	100	$10^3 - 9$	1	10^5	$10^3 - 9$	10^7	10^8
\mathbf{w}	1	10	100	10^3	10^4	10^5	10^6	10^7	10^8
