Maximum Likelihood problem

Consider a monomial function $f_{\mathbf{t}} : \mathbf{x} \mapsto x_1^{t_1} \dots x_n^{t_n}$ from $(\mathbb{C}^*)^n$, defined for some vector $\mathbf{t} \in \mathbb{Z}^n$ in a variety X .

It turns out that the number of critical points of f does not depend on the choice of \mathbf{t} . This is called the **Maximum Likelihood degree** of a model X .

- 1 Introduction
- 2 Matroids
- 3 The Tutte Polynomial
- 4 The Bergman Fan
- 5 Degree of Bergman Fan
 - Degree one
 - Degree of Carman map
 - ML Degree

Matroids

It defines a notion of **independence**. Abstract notion of sets of vectors.

Definition

A matroid M is a pair (V, \mathcal{B}) such that $B \in \mathcal{B}$ are subsets of V , called **bases**, satisfy

- $\mathcal{B} \neq \emptyset$
- For any $B, B' \in \mathcal{B}$, $i \in B \setminus B'$ there is some basis $j \in B' \setminus B$ such that $B \Delta \{i, j\}$ is a basis of M .

Matroids: Examples

The **Uniform matroid** $U_{n,k}$ on n elements of degree k is a matroid of the form $([n], \binom{[n]}{k})$.

The graphical matroid (edges, spanning forests)

Figure: To a graph it corresponds a graphical matroid.

Matroids: Examples

Given a collection of vectors $(\vec{v}_i)_{i \in V}$, a matroid in V given by maximal l.i. vectors.

Figure: Not all matroids are representable.

Circuits

Circuits are minimal independent sets.

Figure: The circuits are all the lines, along with some four-element sets.

Rank function

$$r_M(A) = \max_{I \text{ independent}} |A \cap I|.$$

$$r(1238) = 3$$

$$r(57) = 2$$

$$r(\emptyset) = 0$$

Flats

Maximal sets with a fixed rank.

That is, F is a flat if for any $i \notin F$, $r_M(F \cup i) > r_M(F)$.

$\{\emptyset, \text{matchings}, \text{complete subgraphs}, \dots\}$

$\{\emptyset \subsetneq 1 \subsetneq 01 \subsetneq 0167 \subsetneq 0123456789\}$

Flats: The uniform matroid

Basis of the uniform matroid $U(n, k)$ = all sets of size k in $[n]$.

Any set of size $\leq k$ is independent.

Any set of size $\leq k - 1$ is a flat.

Any complete flag of flats is of the form

$$\{\emptyset \subsetneq \{v_1\} \subsetneq \{v_1, v_2\} \subsetneq \cdots \subsetneq \{v_1, \dots, v_{k+1}\} \subsetneq [n]\}$$

$$v_1 \mid v_2 \mid \cdots \mid v_{k-1} \mid ([n] \setminus \{v_1, \dots, v_{k-1}\})$$

Recap

- Bases = maximal independent sets
- Circuits = minimal dependent sets
- Flats = Maximal sets of a given rank

Dual matroids

If $M = (V, \mathcal{B})$ is a matroid, $M^\perp = (V, \{B^c \mid B \in \mathcal{B}\})$ is its dual.

The dual of a graphical matroid is the graphical matroid of the dual graph.

Figure: A graph and its dual. The corresponding matroids are dual

Activities

Fix total order in V , ground set of a matroid M .

- $i \in B$ is internal activity if $i \in C \subseteq B \cup i$, C circuit.
- $e \notin B$ is external activity if $e \in C \subseteq B^c \cup e$, C^\perp cocircuit (cuts).

$$i(2567) = 0 \quad e(2567) = 1 \quad i(0146) = 2 \quad e(0146) = 1$$

Tutte

$$T_M(x, y) = \sum_{A \subseteq V} x^{r_M(V) - r_M(A)} y^{|A| - r_M(A)}$$

Deletion-contraction invariant if e is not loop nor coloop:

$$T_M(x, y) = T_{M \setminus e}(x, y) + T_{M/e}(x, y)$$

Tutte: Example

Figure: A graphical matroid M , and its deletion and contraction on the edge 1.

$$T_M(x, y) = \sum_{A \subseteq V} x^{r_M(V) - r_M(A)} y^{|A| - r_M(A)}$$

$$T_{M \setminus 1}(x, y) = 1 + 2x + x^2$$

$$T_{M/1}(x, y) = 2 + x + y$$

$$T_M(x, y) = 3 + 3x + x^2 + y$$

Tutte: counting bases

$$T_M(x-1, y-1) = \sum_{B \in \mathcal{B}} x^{i(B)} y^{e(B)} = \sum_{i,j} b_{i,j} x^i y^j$$

Observation

*The number of bases with no external activities (called nbc bases) is **independent of the order chosen***

*The number of bases with no external activities and one internal activity (called β -nbc bases) is **independent of the order chosen***

The Bergman Fan

$$\Sigma_M = \{ \vec{x} \in \mathbb{R}^n / \mathbb{R}\mathbf{1} \mid \forall C \in \mathcal{C} \text{ min } c \in C x_c \text{ attained twice} \}.$$

Figure: An element in the Bergman fan of the graphical matroid

Figure: An element in the Bergman fan of the graphical matroid

Figure: The Bergman Fan is a polyhedral fan

Theorem (Sturmfels Feichner, 2004)

The Bergman Fan of a matroid decomposes into the following cones

$$\Sigma_M = \bigcup_{\mathcal{F} \text{ flag of flats}} \mathcal{C}_{\mathcal{F}} = \bigcup_{F_1 \subset \dots \text{ flag of flats}} \{x_i \geq x_j \text{ whenever } i \in F_k, j \notin F_k\}.$$

Figure: An element in the Bergman fan of the graphical matroid

Problem

Can we compute the degree of the tropical variety Σ_M ?

Just intersect it with a plane!

Planes in the tropical world are Bergman fans $U_{n,k}$

Example of degree computation

Consider M the graphical matroid of K_5 , of rank 4. One has $\Sigma_M \subseteq \mathbb{R}^{10}/\mathbb{R}\mathbf{1}$

$$|\Sigma_{U_{10,7}} + \underbrace{(1, 10, 100, 1000, \dots, 10^9)}_{\vec{\omega}} \cap \Sigma_M| = ?$$

$$\vec{v} = (10^6, 10^4, 10^4, 10^4, 10^4, 10^6, 10^6, 10^8, 10^8, 10^9).$$

\vec{v} belongs to the cone $\mathcal{C}_{9|87|650|1234} \subseteq \Sigma_M$

and $\vec{v} - \vec{\omega}$ belongs to $\mathcal{C}_{7|0|5|1|2|3|4689} \subseteq \Sigma_{U_{10,7}}$

\vec{v} belongs to the cone $\mathcal{C}_{9|87|650|1234} \subseteq \Sigma_M$

and $\vec{v} - \vec{\omega}$ belongs to $\mathcal{C}_{7|0|5|1|2|3|4689} \subseteq \Sigma_{U_{10,7}}$

where $\vec{\omega} = (1, 10, \dots, 10^9)$.

Degree computations

Theorem

$$\deg(\Sigma_M) = 1$$

Theorem (Adiprasito, Huh, Katz, 2015)

$$\deg(-\Sigma_M) = \#\{nbc \text{ bases}\}$$

Theorem (Agostini, Brysiewicz, Fevola, Kühne, Sturmfels, Telen 2022 and Ardila, Eur, P 2022)

$$|\Sigma_{(M \setminus 0)^\perp} \cap_{st} -\Sigma_M| = \#\{\beta - nbc \text{ bases}\}$$

Examples

If M is the graphical matroid

$$|(\Sigma_{U_{10,7}} + \vec{\omega}) \cap \Sigma_M|$$

Then the unique intersection point is

$$\vec{v} = (10^6, 10^4, 10^4, 10^4, 10^4, 10^6, 10^6, 10^8, 10^8, 10^9).$$

Theorem

The unique intersection point of

$$\Sigma_{U_{n,n-r+1}} + \vec{\omega} \cap \Sigma_M$$

lies in $\mathcal{C}_{\mathcal{F}(B)}$, the cone corresponding to the greedy basis with respect to the order induced by $\vec{\omega}$.

Theorem

Each intersection point in

$$|\Sigma_M \cap (\omega - \Sigma_{U_{n,n-r+1}})$$

lies in $\mathcal{C}_{\mathcal{F}(B)}$, the cone of Σ_M corresponding to an nbc-basis with respect to the order induced by $\vec{\omega}$.

Theorem

Each intersection point in

$$|\Sigma_M \cap (\omega - \Sigma_{(M \setminus 0)^\perp})$$

lies in $\mathcal{C}_{\mathcal{F}(B)}$, the cone of Σ_M corresponding to a β -nbc-basis with respect to the order induced by $\vec{\omega}$.
